

ABSTRACT

A parity bit generating section 110 generates parity bits of FEC for error correction from transmission data.

A transmission power deciding section 111 decides
5 transmission power at the time of retransmitting the parity bits from the number of information bits of transmission data and the number of parity bits. A

transmission power controller 112 controls transmission power based on information decided by the transmission

10 power deciding section 111 and outputs the resultant to a radio transmission section 104.
